Adobe Photoshop is a powerful and popular image editing program used by designers, web developers, photographers, and so on. While learning Photoshop is not a requirement, it's always beneficial to know the basics so you can tackle any task with confidence. Read on to learn how to use Photoshop to edit images. Top 10 Things You Need To Know Editing images with Photoshop is by far the simplest way to fix or alter your images. To get started, you should learn the name of each tool so you know what it does. Here is a list of the top 10 tips to be known when editing images with Photoshop. Top 10 Tips When Editing Images with Photoshop 1. The Rainbow Waterfall The original rainbow waterfalls are simple, aesthetically pleasing, and have a flashy appearance. Photoshop provides a rainbow effect in a very simple way—just press Ctrl + J at the right time. To make a watercolor rainbow, go to the Effects > Filter > Photo > Waterslide menu, and choose this effect. Just find the highlight on the final rainbow touch and you're done. 2. Channels Channels are selections that you can use as a mask. Adobe is a powerhouse when it comes to layered editing so choosing to use channels is one of the most powerful ways to edit images. You can use all kinds of images such as stars, frames, or the picture of your heart as channels, and then make your own masks. To make a mask, go to the Editor > Channels menu and choose "Create a New Channel," and a channel icon will be shown in the Layers panel. Then find the number you want to use as a mask. When you use the layer mask button, you can start using it on any image without having to paint on the layer. 3. Meanings of the icons of the Photoshop Elements Image editing with Photoshop Elements is very similar to the full version. The main difference being that it's easier for those who don't have a lot of experience to follow. All of the tools are on the same menu. They function in exactly the same way. To improve the user experience, Photoshop Elements allows you to label the tools with icons. In Photoshop, you can find the icon for a tool by going to the same menu and choosing the desired tool. Some menu names translate to the original language, for example, the Filter menu has "Filters"

1. Field of the Invention The present invention relates to a semiconductor device and a method for manufacturing the same and more particularly to a semiconductor device having a gate insulating film formed by a gap filling method such as a SiGe method. 2. Description of the Related Art A MISFET (MIS=metal insulator semiconductor) having a metal gate electrode is being increasingly used instead of an LDD (LDD=lightly doped drain) type MISFET having a polysilicon gate electrode because the MISFET having the metal gate electrode is capable of decreasing the resistance of the gate electrode. There is, however, a problem in that such a MISFET having the metal gate electrode cannot sufficiently improve the punch-through resistance. Hereinafter, the punch-through resistance of a MISFET having a metal gate electrode will be described. FIGS. 13A and 13B are a plan view and a sectional view of a conventional MISFET, respectively. A silicon substrate 1 has a pair of isolation regions 2 which are set so as to surround a transistor region. The transistor region has a first conductivity type region 3 that is formed in the silicon substrate 1 by a well-known method. A second conductivity type region 4 is set on the isolation regions 2 so as to surround the first conductivity type region 3. Gate electrodes 5 are made of a metal and have a polycide structure. Specifically, a metal wiring 6 is connected to a first conductivity type region 3, and a metal wiring 7 is connected to a second conductivity type region 4. The metal wirings 6 and 7 are connected to the gate electrodes 5. On the surface of a first conductivity type region 3 between the isolation regions 2, a gate insulating film 8 formed on the silicon substrate 1 is laid. At the first conductivity type region 3 between the isolation regions 2, a source region 9 and a drain region 10 are set on the gate insulating film 8. The source region 9 is electrically connected to the metal wiring 6. The drain region 10 is electrically connected to the metal wiring 7. A metal thin film 11 is made of a metal that is the same as the metal used to form the gate electrodes 5 and is formed on the first conductivity type region 3 between the isolation regions 2 so as to be in contact with the gate insulating film 8. A metal thin film 12, which is made of a metal
