Velvet bugs in the city: Genetic analysis of Phasmidius (Scutelleridae) from urban and rural habitats in south-eastern Poland. The aim of this study was to genetically analyse populations of Phasmidius species from southern Poland, to determine the extent of genetic variability and phylogeographical structure. Ten populations (five urban and five rural) from the voivodeship of Lublin (west-central Poland) were analysed. Analysis of mtDNA (COI) resulted in two phylogroups among urban populations (groups A and B) and two among rural populations (groups X and Y), which correspond to the X and Y clades of Bartolozzi et al. (2012) and can be attributed to previously discovered genetic clades based on morphology and the distribution of mtDNA haplotypes. Two mtDNA haplotypes (COI) and 17 allozyme loci (isozymes Gpi, Jh, and Mdh) were found within each mtDNA phylogroup. One population of Phasmidius putosus (group X) is genetically closely related to the former European and North American distributional range of P. minatus sensu stricto. Within the Lublin voivodeship, the genetic structure of P. minatus sensu stricto occurs also in north-eastern Poland (at a distance of 400 km from the border with the European part of c6a93da74d
